

Why we ran this

Directing generative video from a 3D scene

Not to replace the cinematographer. To give them an editable tool.

Experimental material · current possibilities and limits of the workflow

Reference · real living room
environment.jpg

Magnific · visual replacement
final result of the experiment

Character reference
character_reference_woman_40.png

The pipeline

Photographic reference

Spatial and aesthetic intent.

3D reconstruction in Blender

Editable scene built and reviewed in natural language, via Claude Code.

Dummy and action blocking

Positions, contacts and path.

Handheld or designed camera

A phone-shot take, or a camera built into the scene.

Reference render

The base image handed to the AI.

Visual replacement with AI

Identity, materials and realistic finish.

Local iteration in ComfyUI

Local control for new tests.

Scene in Unreal Engine

Real-time render; camera, light and path in-engine.

The same scene: reference photo and rebuilt 3D

Photographic reference
environment.jpg

3D reconstruction in Blender
automatic render of the scene

Blender + MCP · port 9876

From the photo, Claude Code rebuilt the living room in Blender over an **MCP connection**: geometry, scale, materials, camera and light, in natural language. The scene stays editable and gets fixed without leaving the workflow.

Blender as a control space

Blocking · mid-afternoon coffee
cafe_media_tarde_blocking.mp4

Environment on its own
test_manual_entorno_completo.mp4

Simplified dummy
test_manual_dummy_brazo_suave.mp4

Blender keeps what a video generator usually can't offer:
editable geometry, scale, paths, positions, light and camera.

Claude Code automated building the living room, the materials, the dummy, the cameras, the renders and the fixes.

Camera as a human gesture

VirtuCamera turned the phone into a virtual camera. The take could be recorded by hand inside the scene, like a camera operated by a person.

Handheld take · VirtuCamera
test_manual_1.mp4

Camera designed in the scene
coffee_advert_camera.mp4

- The phone defines the camera gesture.
- Blender keeps the path and lets you repeat it.
- The camera doesn't have to be generated from scratch in Magnific.

What worked and what held the result back

Worked

- + Fast reconstruction of an editable scene.
- + Control over camera and composition.
- + Character and environment references with a consistent look.
- + Iteration between 3D and video generation.

Held back

- The generated video inherited some of the dummy's stiffness.
- Prompts don't fix an unnatural body performance.
- Hands, contacts and weight shifts are still fragile.
- Visual replacement doesn't stand in for a convincing motion base.

Magnific · final result

Final render · Magnific
magnific_transform...1lPTYjJr4r.mp4

Blocking in Blender
source scene

We already have a final render in Magnific. It confirms the pipeline can carry character and environment into a realistic image.

- Now
ComfyUI: iterate locally, more control over each test and less dependence on credits.
- Next
Take the 3D scene into Unreal Engine: real-time render, with camera, light and path inside the engine.

3D works as a shared language between directing, camera, animation and video generation.
